

INVENTORS: Christian SAUSKA and Arpad PIROVIC

SERIAL NO.:

TITLE: GERMICIDAL LAMP AND PURIFICATION SYSTEM
HAVING TURBULENT FLOW

ATTORNEY DOCKET NO.: P-2410

FIELD OF THE INVENTION

The present invention relates in general to a germicidal lamp and purification system, and more particularly to a germicidal lamp creating a turbulent flow.

BACKGROUND OF THE INVENTION

Ultraviolet lamps are often used in water purification systems. The ultraviolet or germicidal lamps are used to treat wastewater. Tubular germicidal lamps are often placed in a flow chamber, typically parallel with the direction of fluid flow. One such lamp is disclosed in United States Patent 5,422,487 entitled "Waste Water Purification System With Complementary Interlocking Germicidal Lamp and Socket Construction" issuing to Sauska et al on June 6, 1995,

10054705.01302

which is herein incorporated by reference. Therein disclosed is a waste water treating apparatus for disinfecting a liquid affluent. Germicidal or ultraviolet lamps are disposed within the flow of the affluent or waste water to be treated. The lamps are longitudinally disposed throughout the parallel flow relationship to the waste water flowing there around.

In other water purification systems, the water being treated is kept apart from contacting the germicidal lamp by placement next to independent fluid conduits. Those systems are generally more costly due to the more complicated structure. One such system is disclosed in United States Patent 5,230,792 entitled "Ultraviolet Water Purification System With Variable Intensity Control", issuing to Sauska et al on July 27, 1993, which is herein incorporated by reference.

While these prior water purification systems are generally adequate, they usually require fairly long lengths of water flow. Additionally, while the water adjacent to the germicidal lamp is often treated adequately, however, the water flowing at a greater distance from the germicidal lamp may require additional exposure or treatment time. As a result, the overall

exposure time is often increased to assure that the water more distant from the lamp is adequately treated.

Therefore, there is a need to improve the purification and treatment of a fluid with germicidal lamps. Additionally, there is a need to reduce the overall size of the purification or germicidal system using germicidal lamps, and to reduce the required time of exposure and the thoroughness or evenness of the germicidal effect.

SUMMARY OF THE INVENTION

The present invention is a germicidal lamp used in a purification or germicidal system that increases the turbulence of the fluid flow which improves the germicidal action. A tubular ultraviolet or germicidal lamp has an exterior non-uniform contour for increasing fluid turbulence. In one embodiment, the non-uniform contour is a helical groove along the length of the tubular germicidal lamp. In another embodiment, the non-uniform contour is a double helical groove along the length of the germicidal lamp. The tubular germicidal lamps are placed within the fluid flow, increasing turbulence. This improves the effectiveness of the germicidal lamp. The tubular lamps may

be placed parallel to the direction of flow or transverse to the direction of flow. In another embodiment of the present invention, the germicidal lamp having a non-uniform contour is used to provide a germicidal action in a room. Airflow over the non-uniform contour of the germicidal lamp creates turbulence, which enhances the germicidal effect of the germicidal lamp and purifies the air.

Accordingly, it is an object of the present invention to improve the purification or germicidal treatment of a fluid.

It is an advantage of the present invention that increased turbulence is achieved that improves the efficiency of the germicidal lamp.

It is a feature of the present invention that a germicidal lamp has a non-uniform contour that creates turbulent flow.

These and other objects, advantages, and features will become readily apparent in view of the following more detailed description.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Fig. 1 is a perspective view in partial section of a germicidal lamp 10 of the present invention. The germicidal lamp 10 comprises a tubular envelope 12. The tubular envelope 12 has a non-uniform contour or helical groove 14. The tubular envelope 12 is sealed by end caps 18 and 20. Extending through end cap 20 are connectors 22. Contained

within the envelope 12 is an ultraviolet lamp 16. The envelope 12 is used to protect the ultraviolet lamp 16. The helical groove 14 may be formed in the envelope by any conventional technique. For example, the techniques disclosed in U.S. Patent 3,988,633 entitled "Fluorescent Lamp With Envelope Groove" issuing to Shurgan et al on October 26, 1976, which is herein incorporated by reference. Therein disclosed is a method and apparatus for making grooves in a fluorescent lamp using a plurality of heat sources. Other shaped grooves may be utilized in the present invention provided the grooves provide sufficient turbulence when placed in a fluid flow.

Fig. 2 is a perspective view illustrating another embodiment of the present invention. The germicidal lamp 110 is formed from an ultraviolet lamp 116 with the helical groove 114 formed directly therein. End caps 118 and 120 seal the lamp 116. Electrical contacts 122 extend from end cap 120. The ultraviolet lamp 116 is preferably a fluorescent lamp that produces ultraviolet radiation.

Fig. 3 is a side elevational view of another embodiment of the present invention. The germicidal lamp 210 has an envelope 212 having a plurality of helical grooves 214 formed therein. The helical grooves 214 cross

forming a double helix. Placed within the envelope 212 is an ultraviolet lamp 216. Connector 222 extends from the cap 220 for powering the ultraviolet lamp 216.

Fig. 4 is a plan view of a water purification system 24 according to the present invention. A chamber 26 has a fluid 27 flowing therein in the direction of arrows 28. Initially, the fluid flow is laminar. A plurality of germicidal lamps 10 is placed within the fluid flow 28. The germicidal lamp 10 may be placed having the longitudinal axis substantially parallel to the fluid flow, represented by arrow 28, or transverse to the flow direction. The helical grooves formed in the envelope 12 create a non-uniform contour that generates or creates turbulence in the fluid flow represented by arrows 30. This turbulence in the fluid flow breaks up the laminar flow, represented by arrows 28, and improves the efficiency of the purification system. The turbulence makes possible the more even exposure of the ultraviolet radiation within the volume of fluid. This permits more efficient exposure, which reduces the size of the water purification system as well as the time of exposure required to purify the water.

While Fig. 4 illustrates the application of the germicidal lamp 10 illustrated in Fig. 1, it should be

appreciated that any germicidal lamp having a non-uniform contour may be utilized so as to increase turbulence in the fluid flow. The germicidal lamp 110 illustrated in Fig. 2 and the germicidal lamp 210 illustrated in Fig. 3 may be utilized in the water purification system illustrated in Fig. 4. When the germicidal lamp 110 illustrated in Fig. 2 is used, an additional advantage may be obtained in that increased light output may be created. However, the fabrication of the germicidal lamp 110, as illustrated in Fig. 2, may be more costly.

Figs. 5 and 6 illustrate an air purification system within a room 30. Germicidal lamps 10 are placed near the ceiling of the room 30. Arrows 32 represent airflow adjacent a wall of the room 30. Arrows 34 represents the turbulent airflow after passing over the germicidal lamp 10. A fan or blower 38 may augment the airflow. The germicidal lamp 10 has a non-uniform contour formed by the envelope 12 and the helical grooves 14. In the air purification system illustrated in Figs. 5 and 6 of this embodiment, it may be preferable to utilize a germicidal lamp 110 as illustrated in Fig. 2 without a separate cover or envelope.

10054705:04703
20270504500T

In the air purification embodiment illustrated in Figs. 5 and 6, air may be purified relatively efficiently due to the turbulent flow created by the non-uniform contour of the germicidal lamp 10. Additionally, if desired, flow over the germicidal lamp 10 may be increased with the use of any conventional fan or blower system 38. The germicidal lamp 10 may be shielded from view by shield 36. Additionally, shield 36 may be shaped so as to enhance the airflow to and over the germicidal lamp 10. The air purification embodiment of the present invention may have particular applicability in health care facilities, such as a hospital.

The present invention provides a germicidal lamp and purification system that may be utilized to increase the efficiency of purification systems. Due to the non-uniform contour of the germicidal lamps, turbulence is created that enhances the exposure of the fluid to the ultraviolet electromagnetic radiation emitted by the germicidal lamp. This enhances the germicidal effectiveness and substantially reduces the required exposure time and size of the purification systems.

Accordingly, while various embodiments have been illustrated and described, it will be obvious to those

skilled in the art that various modifications may be made without departing from the spirit and scope of this invention.
